Facilitator Plan

Items needed before class:
AI interface of choice
Shared doc to place class notes
Prepared example prompts
Breakout rooms assigned

Time (by minute)	Topic	Corresponding Slide(s)	Notes
3 minutes	Introducing brainstorming	1 and 2	An introduction to rubber ducking would also be a helpful parallel here. This is all about using a non-human partner to help you clarify your thinking and identify your blind spots, since verbal processing can be more helpful than just being in your head (person-dependent, of course).
4 minutes	How is brainstorming not as productive when you do it alone?	3	Give students 1 or 2 minutes to think and then take suggestions/open up the chat/ do a Zoom survey to have them share out what kind of paths forward they would consider or requests for extra information. It could be great to have a group document where students can dump their

			thoughts, or where the facilitator can post student suggestions so everyone can see them.
2 minutes	What are good techniques for brainstorming? What should we consider? Six Thinking Hats	4 and 5	https://www.debonogroup.com/services/core-programs/six-thinking-hats/
7 minutes	Group brainstorm/think-group-share	6	Since we don't have much time for lengthy discussion but still want to highlight the benefits of diverse perspectives in brainstorming, highlight that students should seek to think out of the box and truly come up with some sort of plan that is substantial here; maybe make it required to turn in for incentive. This should be an AI-free activity, we mostly want to highlight how different students think. They will have time to explore with AI later. Set up breakout rooms before you get to this point so students can start immediately and not wait around. Rooms should have 3-5 students. Take 1 or 2 minutes after breakout rooms close to share out in the class group what some people came up with. Reach some sort of collective agreement that brainstorming in a group is way better than alone.
8 minutes	Group brainstorm -> AI	7, 8, 9, 10, 11,	It would be great to have

	Tips for making prompts stronger How can we structure prompts/requests to encourage our thinking	12	live examples for each of the tips highlighted. Students can follow along and try those examples also.
4 minutes	Independent activity	13	This is when students can try out different prompts on their own and see how the responses differ. Or what happens if they keep following through on one idea, do they get presented with helpful responses? What did students gain from this experience? Encourage students to independently explore topics that mean a lot to them, or to extend on the problem already given.
2 minute	Wrap up!	14	What is one tip/strategy that students found most helpful and will use to make the most of their AI brainstorming skills in the future? What is one they think is not as helpful? A group list of just these answers to be shared after class would be great!

Any extra time can go to the independent activity, so students have more time to figure out which new techniques they like!
If class is running behind on time, encourage chat inputs instead of sharing out to class. Prompt examples are key, can spend less time on slides as long as prompt examples are shown.
